📄 Task-1 Documentation

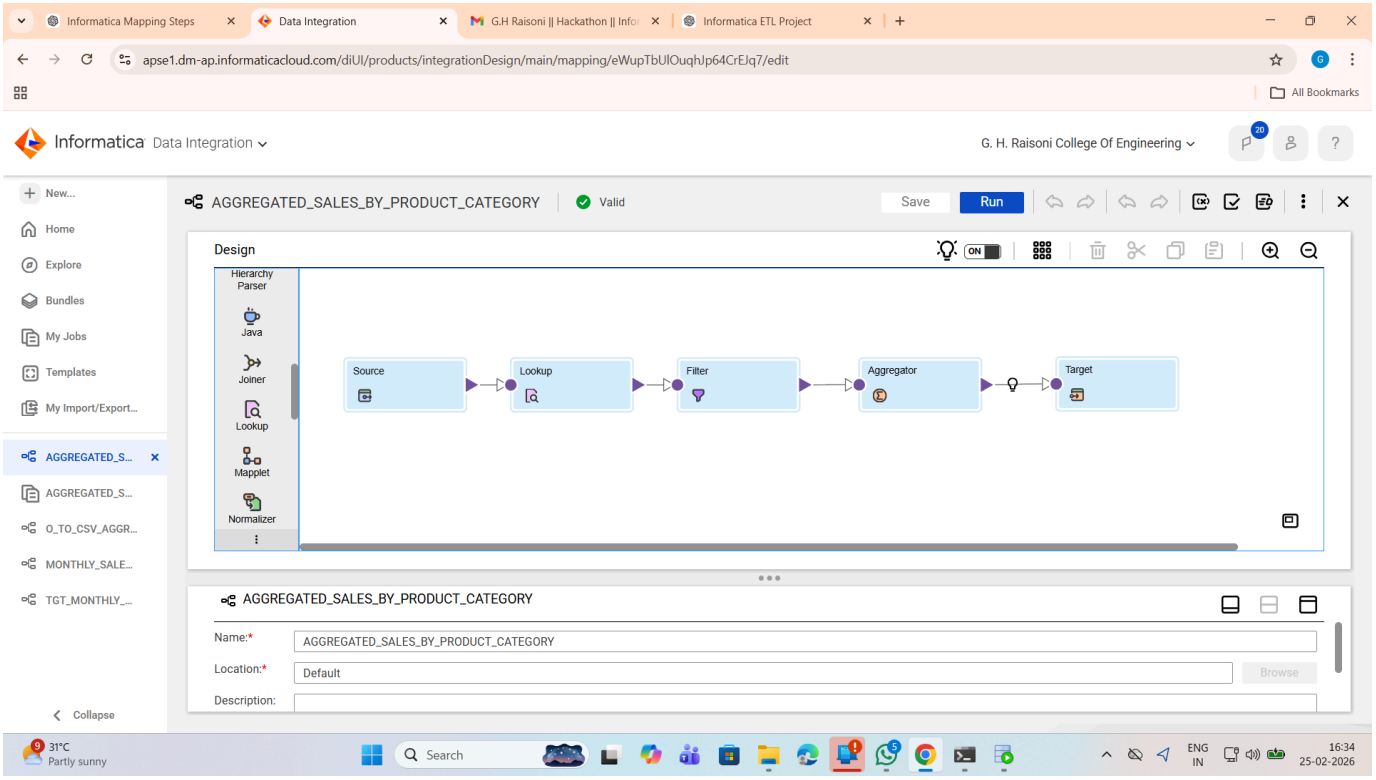
Aggregated Sales by Product Category

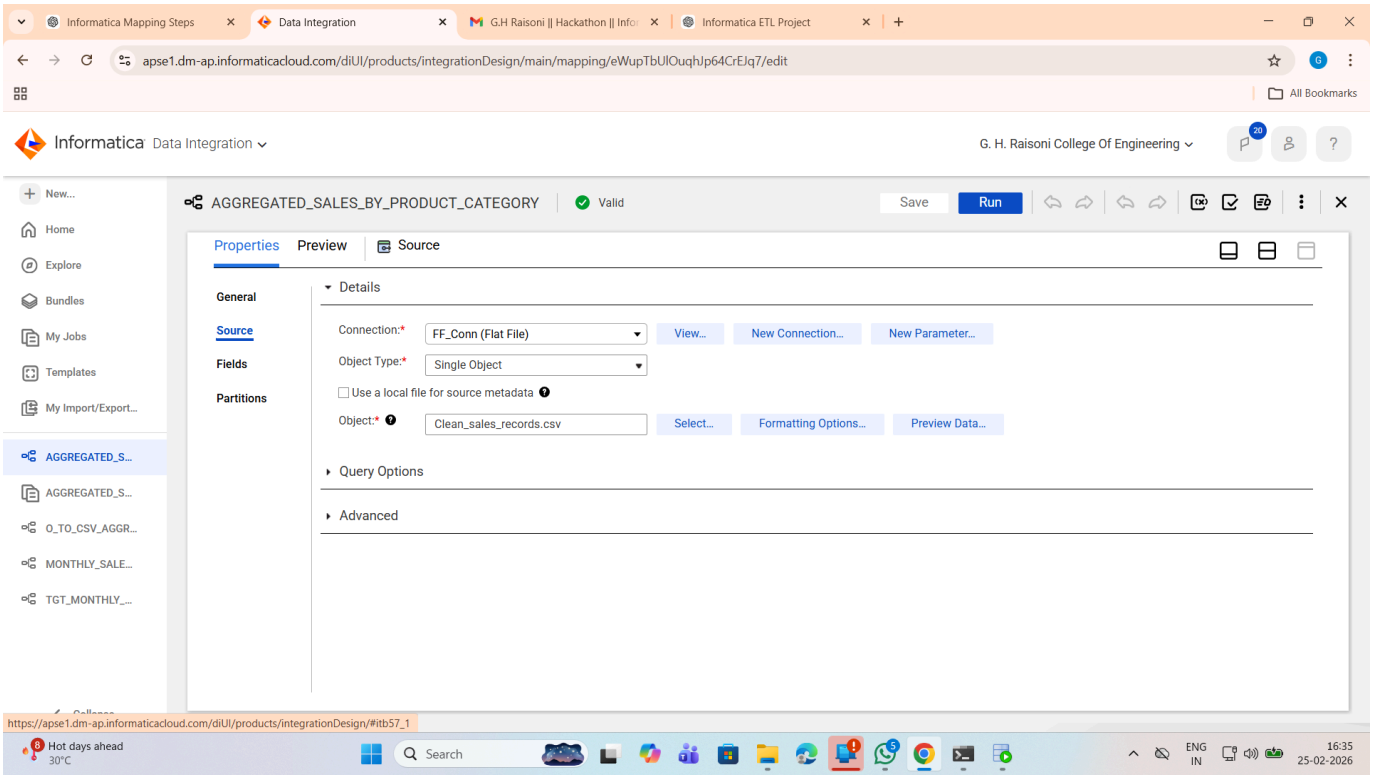
1️⃣ Objective

To summarize cleaned sales data and generate total transactions, quantity, and revenue for each product category.

2️⃣ Source

Clean sales transaction file containing product-wise sales records used for analysis.

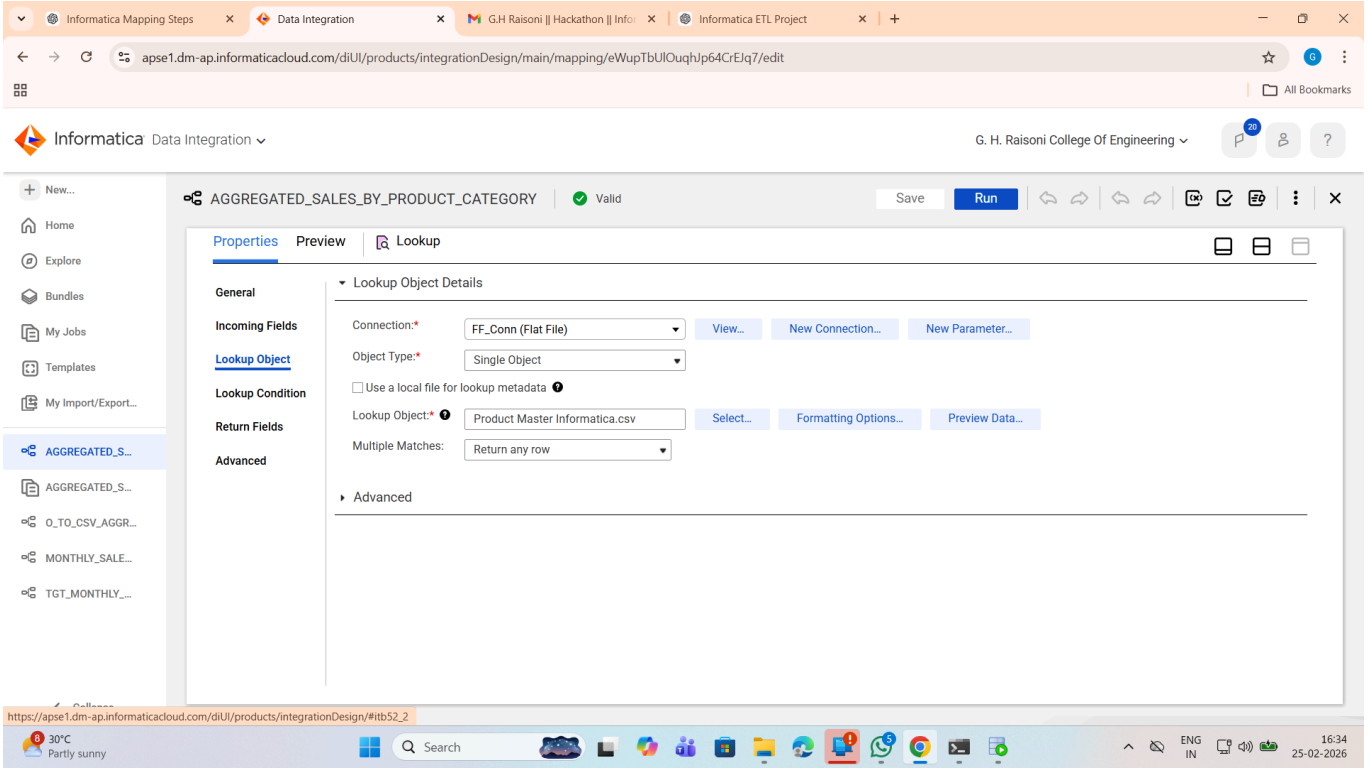




---

3 Lookup

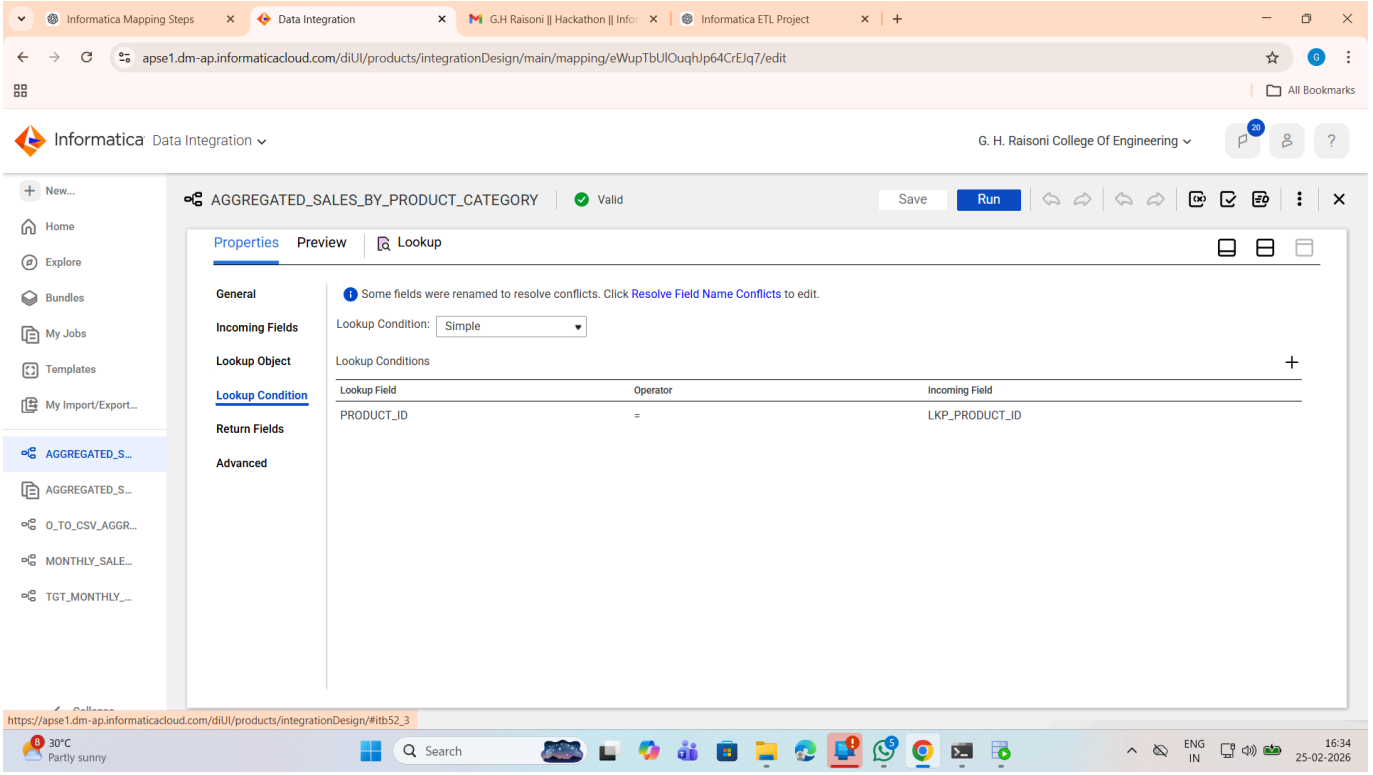
Lookup transformation is used to fetch product category details from the Product Master table using PRODUCT_ID.



---

4 Lookup Condition

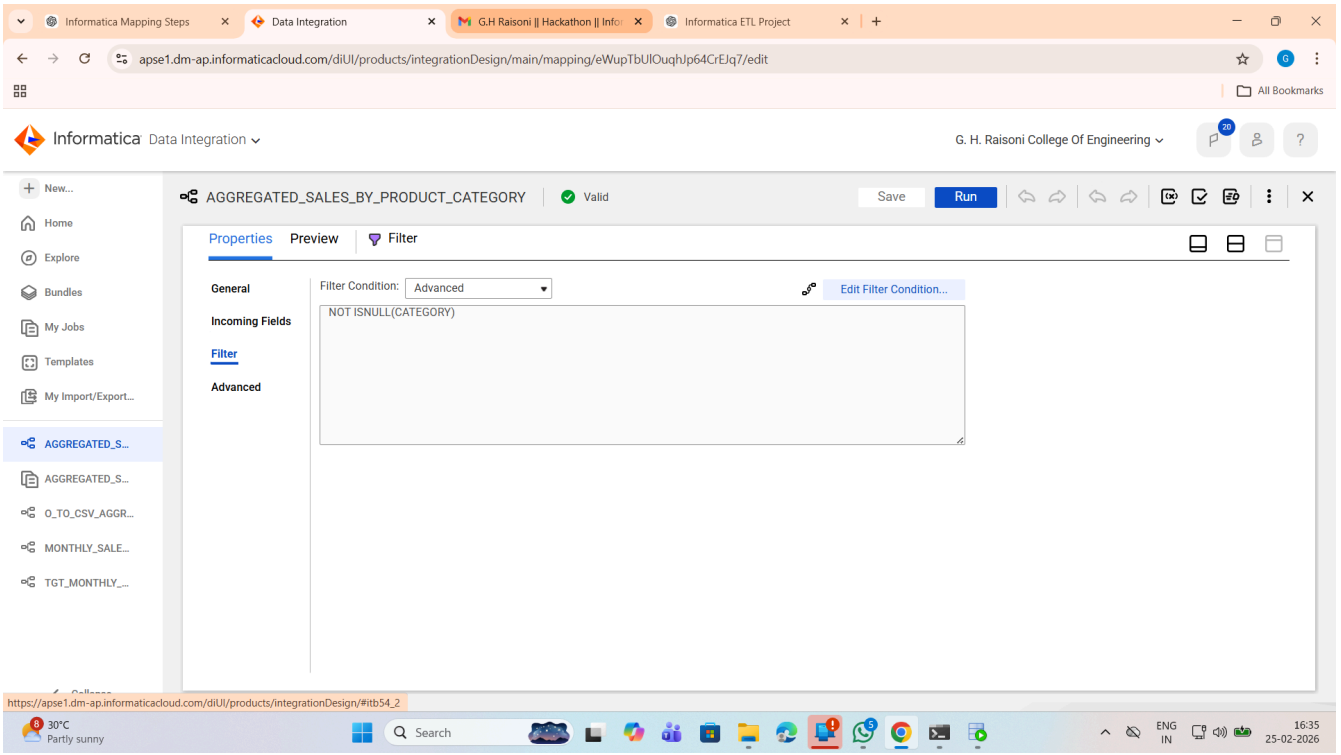
Matches sales PRODUCT_ID with Product Master PRODUCT_ID to retrieve category information.



---

5 Filter

Removes records where category is null to ensure only valid product categories are aggregated.



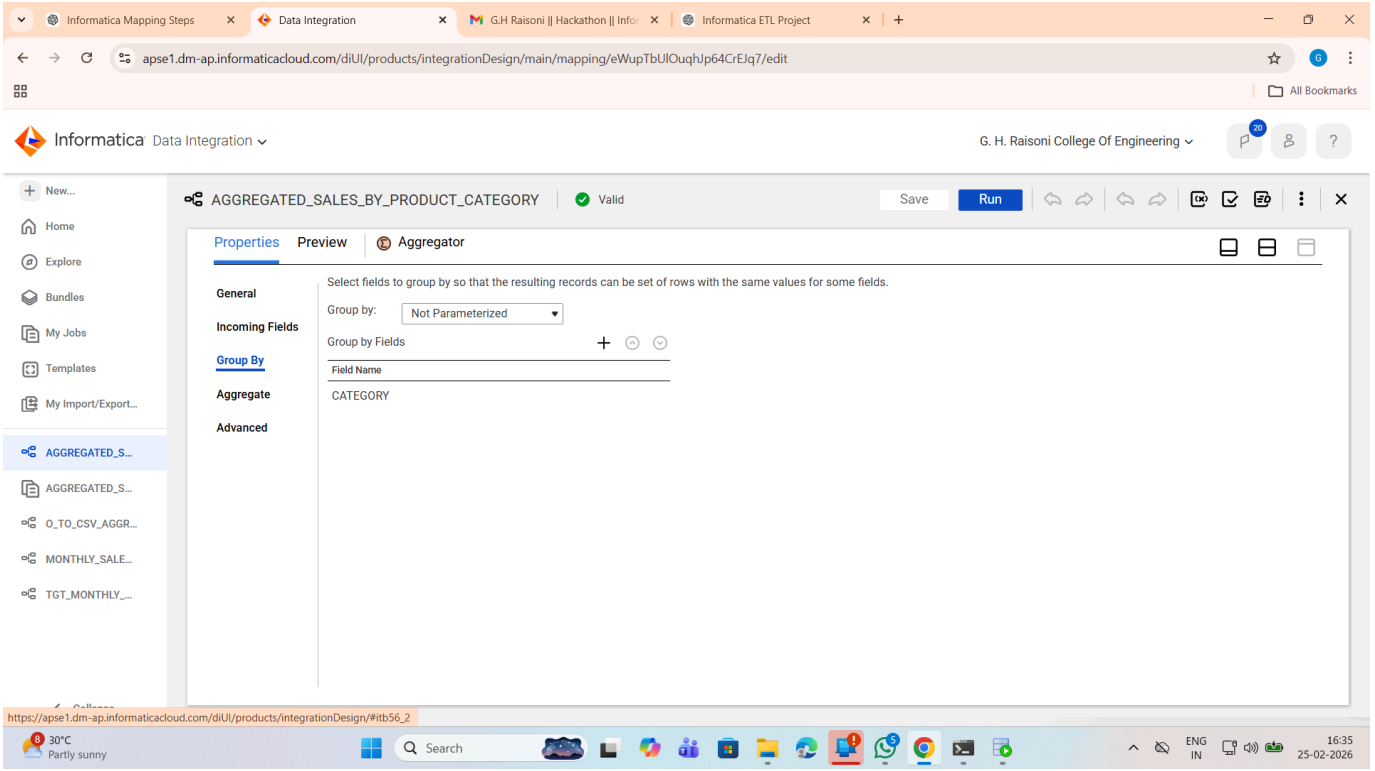
6 Aggregator

Groups sales data by category and calculates summary metrics like count, quantity, and revenue.

---

7 Group By Field

CATEGORY is used as the grouping field to generate category-wise summaries.



---

8 Total Transactions

Calculated using COUNT of transaction IDs per category.

---

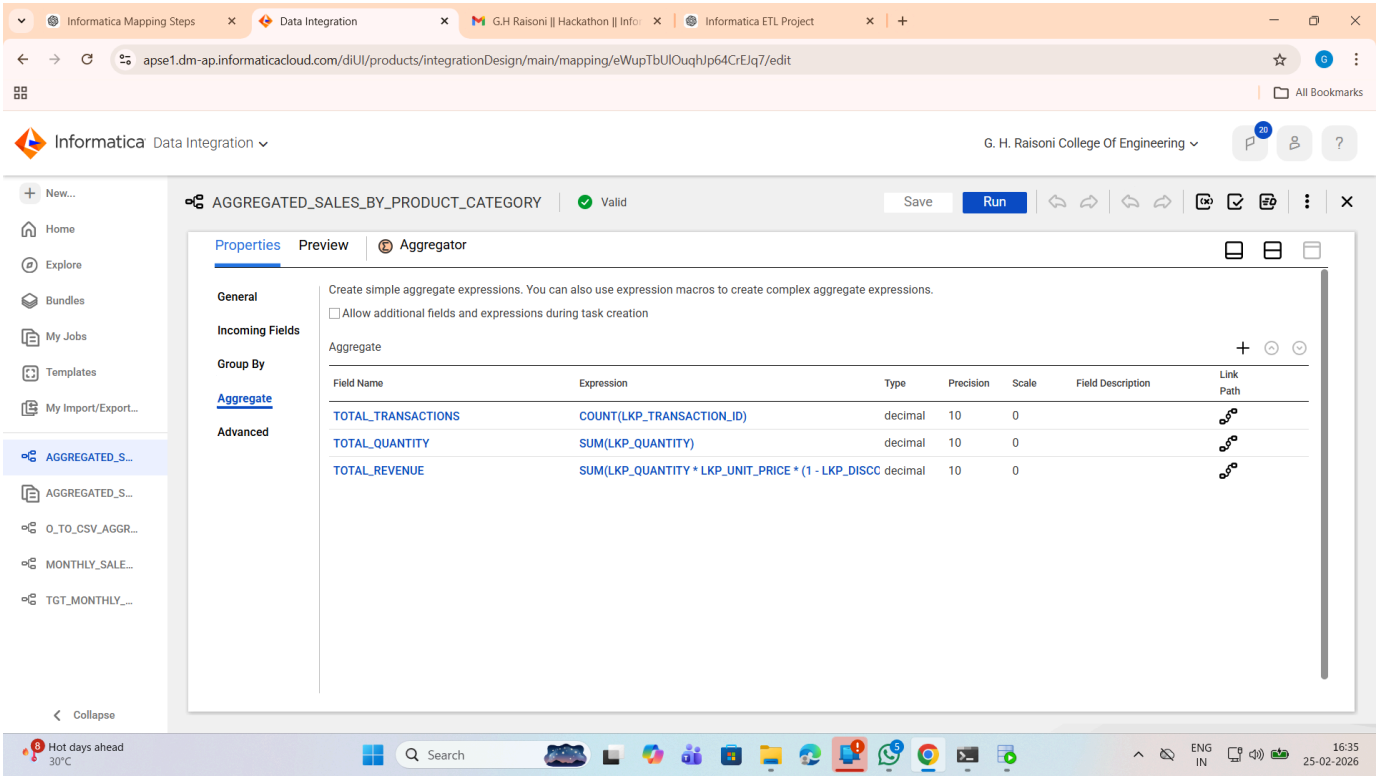
9 Total Quantity

Calculated using SUM of quantity sold per category.

---

10 Total Revenue

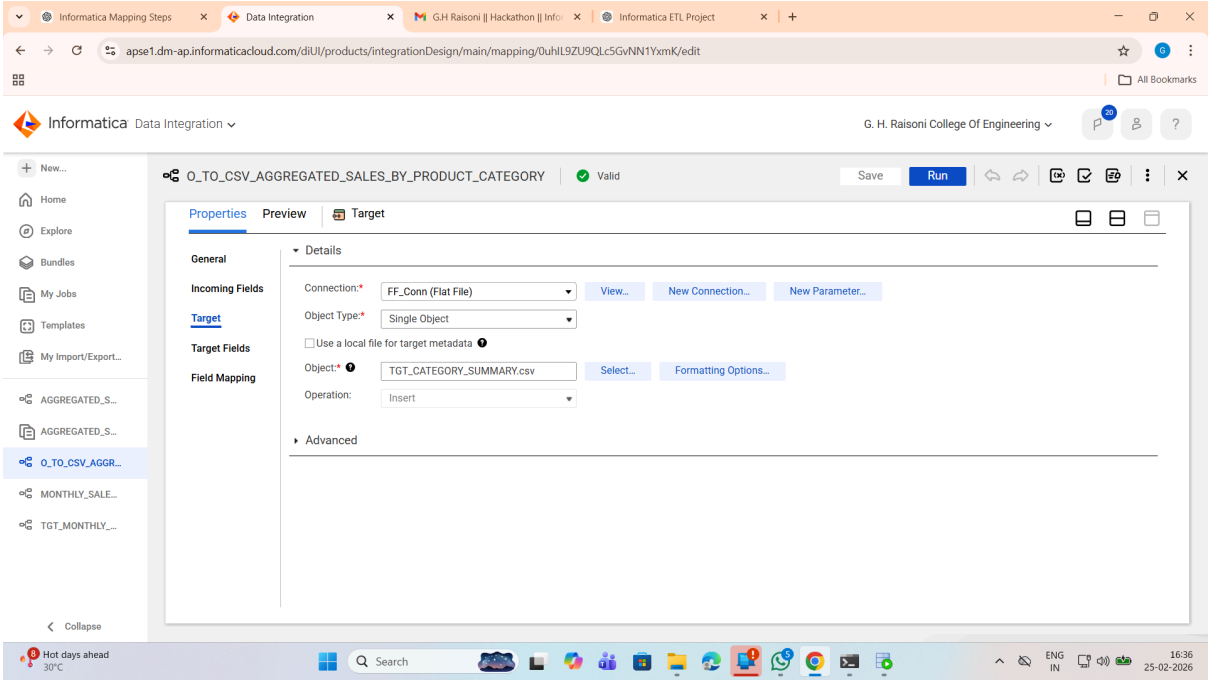
Calculated as SUM of (Quantity × Unit Price × (1 − Discount%)).



---

11 Target

Final aggregated data is stored in TGT_CATEGORY_SUMMARY output file.



---

12 Business Purpose

Helps analyze category performance and revenue contribution.
